An Automated Assessment of Representation to Measure Ecological Representation by Protected Areas in Canada

Tony Iacobelli, Colin Anderson and Angèle Blasutti

World Wildlife Fund Canada,
Technology Transfer Workshop, Edmonton, May 17-18, 2005
Presentation Outline

A) Background
   – Current applications
   – Ecological background and rationale for a national gap analysis

B) Assessment of Representation Methods
   Representation criteria
   Tembec example

C) The AoR 9 Extension
   – Current Status
   – Next steps
Nature Audit 2003

Level of Ecological Representation of Terrestrial Natural Regions in Canada and the adjacent United States - April 2003.
Current application of the AoR

FSC Certification in the Forestry Sector in Canada as of January 2005

- Green star: Achieved FSC certification and HCVF
- Green: Pursuing FSC
- Red: Pursuing HCVF
- Light grey: Canada's Commercial Forest Area

Ecological Representation

- Reserves must be large enough to incorporate functional natural disturbance regimes in order to accommodate seral stage diversity.
- Representation does not seek to preserve characteristic types of communities so much as to maintain the full spectrum of community variation along environmental gradients.

(Noss 1995)

Guiding Principles
- Maintain viable populations
- Sustain ecological processes

(Noss 1992)
Enduring Features and Natural Regions

- Spatial unit for measuring representation, based on landform and climate.
Presentation Outline

A) Background
   - Current applications
   - Ecological background and rationale for a national gap analysis

B) Assessment of Representation Methods
   Representation criteria
   Tembec example

C) The AoR 9 Extension
   - Current Status
   - Next steps
Criteria used to assess the level of ecological representation by protected areas per enduring feature:

1) Size guidelines
2) Connectivity/Adjacency
3) Environmental gradients
4) Important physical habitat types (shorelines)
5) Habitat quality
Size Guidelines – Disturbance Zone

- Size guidelines developed for each Disturbance zone in Canada

- Disturbance zones developed by grouping natural regions exhibiting similar disturbance patterns.
1) Protected Area Size Guidelines

• To determine the ecological size thresholds, reference to the guiding principles:
  – Sustaining ecological processes;
  – Maintaining viable populations of focal species

• Data used:
  – Stock’s national fire database (2002)
  – Other natural disturbance information
  – Faunal habitat requirements.
Size Guidelines – Fire Size Classes

Fire Sizes, Central East Boreal Shield

- Stand

Record: 14 of 18
Protected Area Size Criteria

**Size Score A assigned to EF if Largest Contiguous Block (BLOCKHA) within the EF:**

<table>
<thead>
<tr>
<th>Threshold</th>
<th>Score</th>
</tr>
</thead>
<tbody>
<tr>
<td>&gt; 95% of recommended size</td>
<td>4</td>
</tr>
<tr>
<td>&gt; 75% of recommended size</td>
<td>3</td>
</tr>
<tr>
<td>&gt; 50% of recommended size</td>
<td>2</td>
</tr>
<tr>
<td>&gt; 25% of recommended size</td>
<td>1</td>
</tr>
<tr>
<td>&lt; 25% of recommended size and &gt; 200 ha.</td>
<td>0.5</td>
</tr>
</tbody>
</table>

**If Size Score A <> 4, Size Score B assigned to EF if Total Protected Area (PROTHA) within the EF:**

<table>
<thead>
<tr>
<th>Threshold</th>
<th>Score</th>
</tr>
</thead>
<tbody>
<tr>
<td>&gt; 95% of recommended size</td>
<td>1</td>
</tr>
<tr>
<td>&gt; 50% of recommended size</td>
<td>0.5</td>
</tr>
</tbody>
</table>
2) Connectivity Criterion and Values

- Connectivity criterion assesses the largest overlapping protected area complex on the enduring feature against an ecological integrity value ("Connectivity Value").

- One Connectivity Value per disturbance zone

- Developed based on:
  - Largest protected area size associated with largest enduring feature
  - Regional landscape scale fire disturbance
  - Focal species area requirements.
Connectivity Criterion – Central East Boreal Shield

Size Score C assigned to EF if the Largest Protected Area Complex (TCMPLX) overlapping on the EF:

<table>
<thead>
<tr>
<th>THRESHOLD</th>
<th>SCORE</th>
</tr>
</thead>
<tbody>
<tr>
<td>&gt; 200 ha within EF and ≥ 75% of recommended “Connectivity Value”</td>
<td>1</td>
</tr>
<tr>
<td>&gt; 200 ha within EF and ≥ 25% of recommended “Connectivity Value”</td>
<td>0.5</td>
</tr>
</tbody>
</table>

Connectivity Value (i.e. 100,000 ha) is based on:
- largest enduring feature class
- short term persistence for wolf and caribou.
3) Environmental Gradients Criterion

- Use of digital elevation model;
- Surrogate for capturing habitat or community variability within the enduring feature;
- Elevation variability within the protected portion of the enduring feature is assessed against that of the entire feature.

- Student *t*-test assessment method:
  - Results too restrictive; scores too strict
Environmental Gradients Criterion

- Replaced Student t-test with a “modified variance” statistic (method not yet built in):
  - to compare the elevation range of the protected portion to that of the entire enduring feature.
  - Calculate difference in mean elevation values
    \[ \text{MEANDIFF} \]
  - Calculate the average standard deviation
    \[ \text{AVG(PSTD,ESTD)} \]
  - Calculate proportion of MEANDIFF over the AVG STD:
    \[ \text{MODVAR} = \frac{\text{MEANDIFF}}{\text{AVG(PSTD,ESTD)}} \]
Environmental Gradients

Score assigned to EF if protected portion:

<table>
<thead>
<tr>
<th>THRESHOLD</th>
<th>SCORE</th>
</tr>
</thead>
<tbody>
<tr>
<td>&gt;200 ha within EF and MODVAR ≤ 50%</td>
<td>1</td>
</tr>
<tr>
<td>&gt; 200 ha within EF and MODVAR ≤ 75%</td>
<td>0.5</td>
</tr>
</tbody>
</table>

NOTES on new results:
- More in line with those of previous versions of the AoR
- Still being reviewed.
4) Important Physical Habitat Types

**Score for Habitat Type** assigned to EF based on proportion of shoreline density captured in the protected area relative to proportion of shoreline density in EF:

<table>
<thead>
<tr>
<th>Threshold</th>
<th>Score</th>
</tr>
</thead>
<tbody>
<tr>
<td>No shoreline in EF, or Proportion in protected portion $\geq 95%$ of proportion in EF</td>
<td>1</td>
</tr>
<tr>
<td>Proportion in protected portion $\geq 50%$ of proportion in EF</td>
<td>0.75</td>
</tr>
<tr>
<td>Proportion in protected portion $\geq 5%$ of proportion in EF</td>
<td>0.5</td>
</tr>
</tbody>
</table>
5) Habitat Quality Criterion

Score for Habitat Quality assigned to EF based on proportion of road density captured in the protected portion within the EF:

<table>
<thead>
<tr>
<th>THRESHOLD</th>
<th>SCORE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Road density in protected portion &lt; 0.5 m/ha</td>
<td>1</td>
</tr>
<tr>
<td>Road density in protected portion &gt; 0.5 m/ha and &lt; 1.75 m/ha</td>
<td>0.5</td>
</tr>
</tbody>
</table>
## Representation Criteria Matrix

- Decision rule-based scoring matrix originally developed for the ArcView™ extension.

<table>
<thead>
<tr>
<th>Representation Criteria</th>
<th>Scoring Guidelines for Representation Criteria (scores are indicated in brackets)</th>
<th>Maximum Possible Score</th>
</tr>
</thead>
</table>
| PROTECTED AREA SIZE AND ADJACENCY | A - Largest Single Protected Area Block on Enduring Feature:  
B - Total Area Protected on Enduring Feature:  
C - Size of Largest Contiguous Protected Area Complex Intersecting the Enduring Feature (Adjacency): |  |
|                          | Meets size guideline (>95% of recommended size is protected)  
                          | If Size Score A = 4, skip this step, otherwise:  
                          | Has a minimum of 200 ha overlapping the feature and is >= 75% of the Connectivity Value.  
                          | Has a minimum of 200 ha overlapping the feature and is at least 25% of the Connectivity Value.  | 4  |
|                          | Is at least 75% of the recommended size  
                          | Meets >= 95% of recommended size  
                          | Has a minimum of 200 ha overlapping the feature and is >= 75% of the Connectivity Value.  
                          | Has a minimum of 200 ha overlapping the feature and is at least 25% of the Connectivity Value.  | 1  |
|                          | Is at least 50% of the recommended size  
                          | Is at least 25% of the recommended size  
                          | Has a minimum of 200 ha overlapping the feature and is >= 75% of the Connectivity Value.  
                          | Has a minimum of 200 ha overlapping the feature and is at least 25% of the Connectivity Value.  | 1  |
|                          | Is > 200 ha and <25% of the recommended size  
                          | Is > 200 ha and <25% of the recommended size  
                          | Has a minimum of 200 ha overlapping the feature and is >= 75% of the Connectivity Value.  
                          | Has a minimum of 200 ha overlapping the feature and is at least 25% of the Connectivity Value.  | 1  |
| ENVIRONMENTAL GRADIENTS | If protected portion > 200 ha, and the calculated mean difference over the average standard deviation <= 50%.  
                          | If protected portion > 200 ha, and the calculated mean difference over the average standard deviation <= 75%.  
                          | If protected portion > 200 ha, and the calculated mean difference over the average standard deviation > 75%.  | 1  |
| IMPORTANT HABITAT TYPES (SHORELINE) | Size Score A <> 0 and no shoreline habitat recorded in the enduring feature (precautionary approach); or the shoreline habitat in the protected portion >= 95% of the proportion of shoreline habitat in the enduring feature.  
                          | Size Score A <> 0 and shoreline habitat in the protected portion is at least 50% of the proportion of shoreline habitat in the enduring feature.  
                          | Size Score A <> 0 and shoreline habitat in the protected portion is at least 5% of the proportion of shoreline habitat in the enduring feature.  | 1  |
|                          | (1)  
                          | (0.75)  
                          | (0.5)  |  |
| HABITAT QUALITY | Size Score A <> 0 and protected portion is relatively intact: road density < 0.5m/ha. | (1)  
                          | Size Score A <> 0 and protected portion is less intact: road density > 0.5m/ha and < 1.75m/ha. (thresholds interpreted from Noss 1995)  
                          | Size Score A <> 0 and protected portion is not intact: road density > 1.75m/ha.  | (0)  | 1  |
Representation Scores

• Total Scores grouped into Classes:
  – **Adequate** representation = 6.25-8
  – **Moderate** representation = 3.75-6
  – **Partial** Representation = 1-3.5
  – **Little or No** Representation = 0-0.75
Scenario 1:
existing protected areas
+ Tembec draft deferral options
Scenario 5: existing protected areas + Tembec FINAL deferral options
Presentation Outline

A) Background
   – Current applications
   – Ecological background and rationale for a national gap analysis

B) Assessment of Representation Methods
   Representation criteria
   Tembec example

C) The AoR 9 Extension
   – Current Status
   – Next steps
B) Current Status & What’s New in AoR 9

• ArcView 3.2/ArcGIS 8.3 versions underwent extensive peer review;
• ESRI programming
• Several glitches fixed;
• Several criteria modified and improved:
  – Size guidelines;
  – Adjacency/connectivity;
  – Environmental gradient criterion
Welcome to The World Wildlife Fund Canada's (WWF) landscape-based protected areas gap analysis and GIS tool for conservation planning.

Before running the Assessment of Representation, the user should read the User's Guide provided with the extension.

**Assessment Settings**

I am using:

- Shapefile feature classes
- Personal geodatabase feature classes

Assess representation using *:

- All protected areas and enduring features
- Current Selection of enduring features and protected areas

* The assessment can only assess one layer of protected areas and one layer of enduring features at a time.
AoR Extension – Step 2

Assessment layers
Set the layers and fields to be used in the Assessment of Representation

1. Enduring feature layer or equivalent (POLY)
   Unique feature code field: onlf
   Natural region field: EFCODE

2. Protected areas layer (POLY)
   Field uniquely identifying each polygon: FID
   ON_pas_2003

3. Road/rail/utility line layer (LINE)
   ROADSEG_lc83

4. Drainage - river/streams and shoreline layers (LINE)
   can_water

5. Digital Elevation Model (GRID)
   canada_dem

Step 2/4
WWF has developed protected area size guidelines for the various natural disturbance zones across the country. The methods and data used to determine these size guidelines and disturbance zones were based on the spatial scales of natural disturbances, habitat requirements of selected focal species, and the enduring features.

Select a disturbance/ecological process regime that is characteristic of the area that you wish to assess:

2 - Central East Shield - Fire

To determine in which WWF natural disturbance zone the enduring features are found, refer to the natural disturbance zone map or the DIST_ZONE field in the enduring features layer. Alternatively, the user can select a proportional value (i.e. 30% of the enduring feature).

The equation listed below represents the relationship between the Protected Area size (Y) and the Enduring Feature size (X), or a pre-determined proportion of the enduring feature. The equation is the basis for determining the recommended protected area size for this assessment. Details on the methods used to derive the equations are available in the

<table>
<thead>
<tr>
<th>ID</th>
<th>INTERCEPT</th>
<th>EQUATION</th>
<th>SYSTEM</th>
<th>TYPE</th>
<th>INTEGRITY</th>
</tr>
</thead>
<tbody>
<tr>
<td>32</td>
<td>0.8783</td>
<td>Y = 0.8783X - 0.246</td>
<td>2 - Central East Shield - Fire</td>
<td>Log</td>
<td>100000</td>
</tr>
</tbody>
</table>
AoR Extension – Step 4

Output specifications

Select the output format for the assessment results

- Natural Region Representation Results
  - Calculate natural region representation statistics
  - (Natural region field must be identified in the assessment layers panel for this option)

- Enduring Feature Representation Results - File Specifications
  - Tabular file only
  - Tabular file joined to the enduring feature layer

Conduct Assessment
Applying the AoR9 Routine

- 3E1 example base on existing protected areas

Refer to Excel Spreadsheet “3E1 comparison”
NOTES on the AoR 9

• The routine produces repeatable results, however, the data inputs need to be consistent:
  – Scale of the data can affect scores
  – Projection of the data layers may affect area calculations
  – Inconsistent feature selections may result in inconsistent results
  – Variations in data layers may affect all criteria
Advantages of the AoR 9

- Uses freely available data
- Canada wide
- Peer-reviewed
- Up-to-date with ESRI software
- Improved assessment of criteria
- Produces repeatable results
Limitations of the AoR 9

• Downloadable base data is coarse
• Technical limitations inherent to ArcGIS 9
• Limited to ArcGIS 9 users
• Not a candidate selection tool
• Not a habitat suitability model
• Requires a few data preparation steps before running
Next Steps

• Incorporate new features into AoR9

• Further review the criteria thresholds and size guidelines.

• Update accompanying documentation and release new routine.

• Post the AoR routine on the WWF website.
Current Availability of AoR

- AoR extension, enduring features data and documentation are found on WWF’s FTP:
  - ftp://forests:gc678yy@wwf.ca

- Notes:
  - The AoR9 extension and the User’s Guide are currently being updated to be posted.
